
Build Custom AI Assistants

From prompts to products: Custom GPTs, Gemini Gems, Markdown Prompting, agentic workflows — and the 5-level path from AI user to AI builder

Generative AI Mastermind · Outskill · Resource Guide

🕒 **Session:** Build & Automate — your first custom AI assistants, on both ChatGPT and Gemini

📁 **What's inside:** Every framework, workflow and tool from the session — including the complete Markdown Prompting structure and a full worked example you can copy

✦ **How to use:** Read once, then ship one Custom GPT or Gem this week using the template in §9

1. From Prompts to Products

In the previous session you learned the *language* of AI. In this session you stop talking to AI and start **building with it**: Custom GPTs, Gemini Gems, structured Markdown Prompting, agents that mimic your writing, and a 5-level roadmap that takes you from user to builder.

Use this guide as your blueprint — every framework, every workflow and every tool referenced in the session is captured here so you can build, ship and iterate at your own pace.

1.1 The AI Generalist mindset

Thriving in the age of AI demands a mindset shift: away from deep specialisation in a single domain, toward solving problems across multiple disciplines using AI as your leverage. Three principles:

Principle	What it means
Adaptability	The single most critical skill is the ability to learn. In a fast-moving landscape, grasping new concepts and tools quickly is paramount.
Problem first	An AI Generalist is a problem solver at their core — leveraging AI to tackle challenges irrespective of industry or domain.
Flexibility	Rather than being confined to a single profession, prepare to adapt and pivot as technology progresses.

What this session unlocks

The professionals who thrive aren't the ones who know AI best — they're the ones who can turn any problem into an AI workflow. Today you build your first custom AI assistants — inside both ChatGPT and Gemini — and learn the structured prompting framework that takes you from playing with AI to producing real, reusable tools.

2. Custom GPTs — Anatomy of a Micro-App

A **Custom GPT** is a packaged version of ChatGPT built for one specific job. It's a micro-app on top of the AI model — no code, no infrastructure. You build it once and reuse it forever.

2.1 The 6 components of a Custom GPT

#	Component	What goes in it
1	Name	Short, descriptive, memorable.
2	Short description	A one-line summary of what the GPT does — the mini prompt.
3	Instructions	The full system prompt: role, task, format, constraints. This is where the magic lives.
4	Conversation starters	Quick-launch prompts users can tap to begin.
5	Knowledge	PDFs, docs and datasets the GPT can reference.
6	Capabilities	Toggles for web browsing, image generation, data analysis / code.

3. ChatGPT GPTs vs Gemini Gems

Two platforms, same idea: **build once, use forever**. The session's worked example was the **XPOST Generator** — a tool that turns one topic into 10 viral tweet ideas with virality scores in a table.

3.1 ChatGPT — the Custom GPT walkthrough

- **Define the goal.** Generate 10 tweet ideas, score each 1–10 for virality, output as a table.
- **Instruct the AI.** Write the behaviour in natural language inside the GPT Builder's Configure tab.
- **Refine & iterate.** The first pass gave only 1 tweet — the fix was adding "10 tweets, virality score, table format" to the instructions.
- **Prompt → tool.** A complex prompt you'd otherwise retype every day becomes a reusable, named app.

3.2 Gemini — Gems, the free alternative

Don't have a paid ChatGPT account? Google's **Gems** give you the same building primitive — for free.

- **Free to use.** Custom GPTs may need a subscription; Gems don't.
- **Same flow.** Name your Gem, write instructions, save, use.
- **Sheets integration.** Export generated output directly to Google Sheets — huge for data-shaped tasks like the XPOST table.

The big mental-model shift

A custom GPT is a packaged prompt. You're trading raw prompting for reusable, shippable tools.

Pro tip — iterate aggressively in the Configure pane

Don't expect the first set of instructions to be perfect. Run a test, see what's missing, then go back and add the constraint. **Build → test → refine.** That loop is the entire job.

4. The Markdown Prompting Formula

To build powerful AI assistants, you need a structured way to talk to AI. The **Markdown Prompting** framework treats your prompt like a brief you'd hand to a human team member — and uses markdown syntax (#, **) to signal hierarchy and importance to the model.

4.1 The structure at a glance

This is the special prompting structure for Custom GPTs and Gems — the exact skeleton from the session:

```
# **Role:**

# **Objective:**

# **Context:**

# **Instructions:**

  ## **Instruction 1:**
  ## **Instruction 2:**
  ## **Instruction 3:**

# **Notes:**
  • Note 1
  • Note 2
  • Note 3
```

4.2 The 5 stages, explained

Stage	What it does	Example
01 — Role	Define the persona. Set the AI's expertise and tone before anything else.	# **Role:** You are an expert social media writer who has written tweets for hundreds of profiles.
02 — Objective	State the primary goal. One sentence — the single outcome the AI must deliver.	# **Objective:** Solve learner problems by responding to their questions via email.
03 — Context	Explain the why. Background that helps the AI make nuanced calls — who's reading, what's at stake.	# **Context:** Prompt, helpful replies drive better customer experience and business growth.
04 — Instructions	Step-by-step directions. Numbered, sequential, no gaps — each step is one action.	## **Instruction 1:** Open the email. ## **Instruction 2:** Read fully. ## **Instruction 3:** Respond...
05 — Notes	Constraints, edge cases, exceptions — formatting rules, things to avoid, tone caveats.	# **Notes:** • Always tag @outskill • Use line breaks per sentence • Output in plain text

4.3 Markdown syntax — quick reference

You type	The AI reads
# H1	Heading 1 — a top-level section of your brief
## H2	Heading 2 — a sub-section (e.g. individual instructions)
### H3	Heading 3 — finer detail within a sub-section
bold	Bold text — signals importance to the AI

5. An Agent That Writes Like You

The session's most powerful build: an AI that learns your unique writing voice and recreates it on demand. Three steps, no code. The same recipe works for LinkedIn, Twitter, blogs — anywhere you have your own samples to feed in.

Step	Stage	What you do
1	Content DNA analysis	Feed the AI 10 of your highest-engagement posts. Ask it to produce a deep "Content DNA" report — tone, voice, sentence structure, vocabulary, hooks, the hidden patterns.
2	Build the master prompt	Ask the AI to convert the DNA report into a comprehensive Markdown Prompt — Role, Objective, Context, Instructions, Notes. This becomes the recipe that teaches any AI to write exactly like you.
3	Ship the tool	Paste the master prompt into a new Custom GPT or Gemini Gem. Any topic, any time — output in your voice, on demand.

Pro tip — make the model compete

After the first DNA analysis, tell the model that a rival AI gave you a better analysis. It will work harder the second time and dig out patterns it skimmed past on the first attempt.

5.1 The full flow — clone your LinkedIn voice

- **1. Collect your voice.** Grab 10 of your highest-engagement LinkedIn posts — the more performant, the cleaner the signal.
- **2. Build the analyser prompt.** Ask ChatGPT to dissect tone, structure, hooks, CTAs and formatting — a forensic deep-dive on what makes your style.
- **3. Run the deep-dive.** Feed in the 10 posts plus the analyser prompt. Output: your Writing DNA report.
- **4. Distill into a creator prompt.** Convert the analysis into: "When I give you a topic, write a LinkedIn post in this style..."
- **5. Generate on demand.** Save it as a GPT or Gem. Every post now starts as 80% of you — you spend your time editing, not drafting.

6. From Idea to Post — the Content Workflow

Bring it all together. Once your Custom GPT and writing-style agent exist, a single content piece moves from raw idea to publish-ready in minutes, not hours:

#	Stage	What happens	Tool
1	Idea generation	Pull trending news and content angles relevant to your niche — spot the wave before it breaks.	Social Sonic
2	Content generation	Drop the article or angle into your custom Post Writer agent. It drafts in your voice, instantly.	Custom GPT / Gem
3	Refinement	The first pass is rarely the final draft. One follow-up nudge typically lifts quality dramatically.	Self-refine loop

Pro tip — the refine re-prompt that consistently doubles quality

✓ **Prompt:**

"You did not follow all the instructions. Make sure you follow all the instructions again and rewrite the post."

Why this matters: the compounding value isn't in any single output — it's in the system. You build the GPT once, you define the workflow once, and every piece of content you ever produce gets cheaper, faster and more on-brand than the one before it. *That's the AI Generalist's edge.*

7. The 5 Levels to AI Generalist Mastery

A structured path from foundational prompting to building real AI products. Each level compounds on the last:

Level	What you master
Level 1	Master advanced prompting techniques, experiment with multiple AI models, run open-source LLMs locally, and fine-tune parameters using OpenAI Playground.

Level	What you master
Level 2	Integrate connectors using MCP — both online and offline. Then, design system prompts to power fully autonomous voice agents.
Level 3	Learn about Diffusion Models. Build your own AI Clone, create Images & Videos, Ads, Branding Material, Movies.
Level 4	Build complex automations & agentic workflows for process optimization. Get hands-on with AI Agents.
Level 5	Build a real-world AI product without writing a single line of code!

7.1 Level 1 — Foundations: mastering prompting & models

- **Advanced prompting.** Move past simple Q&A. Use structured frameworks like Markdown Prompting (Role, Objective, Context, Instructions, Notes) to extract nuanced, high-quality outputs.
- **Experiment with multiple models.** Use platforms like OpenRouter and Bolt AI to access hundreds of models — open and closed — and find the right one for each task.
- **Run LLMs locally.** Install Ollama to run powerful open-source models (Llama, Mistral, Qwen, DeepSeek) directly on your machine — no internet, total privacy.
- **Fine-tune parameters.** Use Playground environments to control temperature, presence penalty and frequency penalty — dialling in creativity vs. determinism.

7.2 Level 2 — Connect: autonomous voice agents with MCP

- **Model Context Protocol (MCP).** The breakthrough that lets AI *use tools*. Instead of describing tasks, AI does them.
- **Online integration.** Connect Claude to web services like Apify. One prompt: scrape an Instagram profile, analyse top content, get transcripts, rewrite in your style — work that would otherwise take days.
- **Offline integration.** Tools like Goose give AI access to local folders — analyse files, surface duplicates, free up disk space, fully autonomously.
- **Voice agents via VAPI.** MCP + VAPI = AI that makes phone calls for you: reads context, delivers messages, answers questions in real time.

7.3 Level 3 — Create: diffusion models for creative content

- **Diffusion models.** The technology underneath every AI image and video generator. Understand the mechanics — control the output.

- **AI clone creation.** Build a complete digital replica — your image, your voice, your scripts — that creates content, engages followers, and even takes brand deals.
- **Automated content engine.** Stunning images, videos, ads and branding generated on demand at scale. Marketing teams of one are now possible.

7.4 Level 4 — Automate: agentic workflows for process optimisation

- **AI agents.** Not just tools — autonomous systems with goals. They plan, act, observe and adjust until the goal is met.
- **Web researcher agent.** An agent tasked with visiting Y Combinator, analysing every company in a batch, identifying consumer-tech relevance, and compiling findings into a Google Sheet — fully autonomous.
- **Executive assistant agent.** The same agent in Slack, plus Fireflies.ai for note-taking: manages calendars, books meetings, attends meetings, summarises outcomes.
- **Agentic browser — Comet by Perplexity.** The browser itself becomes the agent: *"Check my unread LinkedIn messages and summarise the important ones"* — and it just does it.

7.5 Level 5 — Build: AI products without code (vibe coding)

- **Vibe coding.** A new paradigm: build fully functional applications by describing what you want in natural language. Tools like Bolt, v0 and Replit Agent turn specs into shipped software.
- **Solve real problems.** Example from the session: an "AI Creative Strategist" tool — input a creative idea in plain text, get back multiple sophisticated image-generation prompts ready to run. It replaced lakhs in design spend.
- **From user to builder.** The transformation: you stop searching for tools that solve your problem — you build the tool yourself, in an afternoon.

The pay-off

Five levels, one transformation: from someone who **uses** AI to someone who **creates** with it. You become the strategic problem solver capable of building immense value in any field — that's the entire point of the Mastermind, and why each level compounds on the last.

8. Worked Example — the LinkedIn Post Generator

A complete Markdown Prompt — exactly the structure you'd paste into a Custom GPT or Gem to ship a working tool. Use it as a template: keep the skeleton, swap the specifics for your own use case.

Role:

You are a creative and dynamic LinkedIn content writer for Outskill, specializing in crafting viral posts that are engaging, personal, and highly shareable.

Objective:

Write a viral LinkedIn post that encourages engagement and promotes the 2-day Generative AI Mastermind by Outskill. The post should reflect the learner's excitement, commitment, and accountability – and encourage others to join the waitlist.

Context:

The learner has shared:

- Why they are excited to join the 2-day Generative AI Mastermind.
- What they currently do professionally.

Use this information to craft a viral LinkedIn post with an attention-grabbing hook, storytelling, and industry-specific personalization. The learner should be excited to spend 16+ hours over 2 days mastering AI tools and techniques – and ready to share their learnings once the mastermind is over.

Instructions:

Instruction 1: Hook Creation

- Write a strong, attention-grabbing hook highlighting the learner's excitement about dedicating 2 full days (16+ hours) to mastering AI – make it public for accountability.
- Make sure you come up with something original every time.
- Try to tag @Outskill in the hook and, if possible, @vaibhavisinty.
- Ensure each sentence has a line break for proper LinkedIn spacing.
Example: "I'm dedicating my entire weekend – 16+ hours – to mastering AI tools, and I'm putting it out here so you can hold me accountable!"

Instruction 2: Storytelling & Personalization

- Expand on the learner's personal journey and reasons for joining.
- Mention relevant sessions:
 - Session 1: Intro to Generative AI & LLMs – transformers and prompt engineering.
 - Session 2: Diffusion models and their future potential.
 - Session 3: Image & video generation.
 - Session 4: Custom GPT creation and Assistant API.
 - Session 5: AI automations with no-code tools.
- Include a learner highlight section: "Here's what I'm most excited about"

Instruction 3: Post-Session Accountability

- After the 2-day event, the learner shares their learnings: "Once these 2 intense days are over, I'll be back to share everything I've learned. Feel free to keep me accountable!"
- Highlight tasks they'll complete:
 - TASK 1.1: Creating their own prompt library.
 - TASK 1.2: Building an app using Claude.ai.
 - TASK 2: Creating a seamless video using AI-generated images and voiceovers.
 - TASK 3: Developing a custom GPT for a specific use case.

Instruction 4: Call to Action

- Close with a direct CTA: "Btw, want to join the next 2-day Generative AI Mastermind?"
- Include the waitlist link: outskill.com/mastermind-referral
- Encourage urgency with a reminder of limited seats.

```
# **Notes:**
```

- Tag @Outskill and @Vaibhav Sisinty at the top to maximize visibility.
- Each sentence on a new line – add 3 line breaks (or whitespace) after every line for clean LinkedIn formatting when copied.
- Add hashtags at the end: #Outskill #AIMastermind
- For text bolding, use the format: ****Bold text**** in the output.
- Always deliver the output in a code editor / plain text block so formatting doesn't break when copying to LinkedIn.

How to use this template — three steps to ship your own version

- ✓ **Copy the structure, swap the specifics.** Role, Objective, Context, Instructions, Notes — keep the skeleton, change the body.
- ✓ **Paste it into a Custom GPT or Gem.** The Instructions field is where the magic lives. Save, name, ship.
- ✓ **Run, refine, repeat.** The first output won't be perfect — use the "You did not follow all the instructions" nudge from §6.

9. Master Tool Index

Every tool referenced in the session — what it does, where to find it. Bookmark this page.

Tool	Link	What it does
ChatGPT	chatgpt.com	Core AI chat & Custom GPT builder by OpenAI
Gemini	gemini.google.com	Google's AI assistant — free Gems for app-style tools
OpenAI Platform	platform.openai.com	API, Playground, model fine-tuning environment
Emily.ai	link.outskill.com/emily-outskill	Outskill-recommended productivity assistant
Fireflies.ai	fireflies.ai	AI meeting recorder, transcriber, note-taker
Perplexity AI	perplexity.ai	AI search engine with cited answers

Tool	Link	What it does
Numerous AI	numerous.ai	AI inside Excel & Google Sheets for analysis
VAPI	link.outskill.com/vapi-outskill	Build & deploy AI-powered voice agents
Chronicle HQ	link.outskill.com/chronicle-outskill	AI-powered presentations & decks
OpenRouter	openrouter.ai	One API, hundreds of AI models from every vendor
Bolt AI	boltai.com	Desktop UI to chat with multiple models via OpenRouter
Ollama	ollama.com	Run open-source LLMs locally, no internet needed
Bolt	link.outskill.com/bolt-outskill	No-code AI website & app builder (vibe coding)
v0	v0.dev	Vercel's tool — text prompts → React UI components
Apify	apify.com	Web scraping & automation platform — MCP compatible
Goose	block.github.io/goose	Open-source MCP tool for local file management
Happy Scribe	happyscribe.com	Automatic audio & video transcription
Comet (Perplexity)	perplexity.ai/comet	Agentic browser — AI that completes web tasks
Social Sonic	socialsonic.com	Trending news + content idea engine for creators

10. You're Now a Builder

Onwards

The previous session was about **understanding**. This session was about **building**. Next up: the creator's playground — diffusion models, AI clones, and multimedia generation at scale.

Until then — go ship a GPT. Go ship a Gem. Get reps in.

See you in the next session. — Team Outskill
